

# **Ensuring Nuclear Safety in fleet mode of Indian PHWRs**

U. C. Muktibodh Director (Technical) NPCIL

### **Setting up of Fleet mode Reactors**

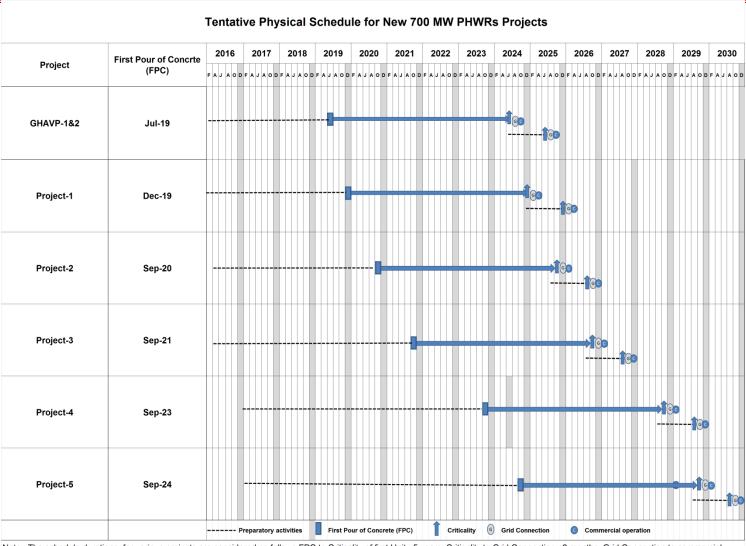

First time in the history of DAE financial sanction is issued by Government of India for 10 reactors in fleet mode.

➤ The work on 2x700 MWe PHWRs at GHAVP has just commenced.

➤ All these reactors are planned to be progressively commissioned from year 2024 to 2031.

#### **Setting up of Fleet mode Reactors**

Note: The schedule durations for various projects are considered as follows.FPC to Criticality of first Unit: 5 years, Criticality to Grid Connection: 2 months, Grid Connection to commercial operation: 1 month, Phasing between 1st & 2nd units is considered 12 months.

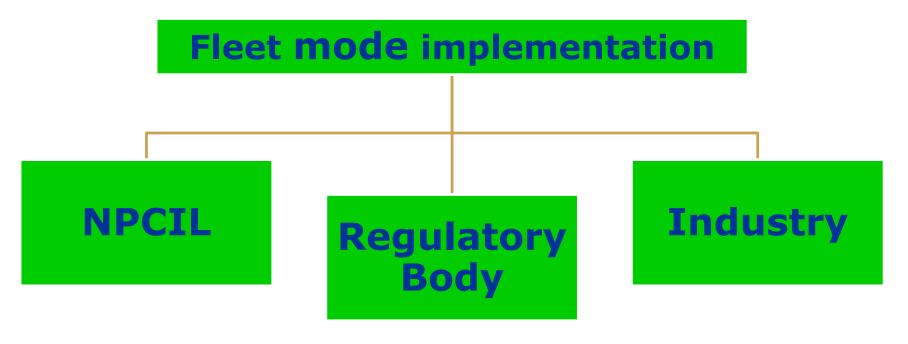

#### **Setting up of Fleet mode Reactors**

- > The fleet mode schedule is drawn based on Industry feed back and achievable targets.
- ➤ The plan involves investment of about Rs. 1,25,000 Cr.
- > 70% of this investment will be in manufacturing sector and 25% will be in Construction sector.
- > This is a mammoth task and entire nuclear industry need to take up this challenge.

These agencies have a definite role to play for successful implementation of program.

#### **Ensuring safety**

Ensuring safety of NPP begins from site selection and continues till decommissioning of the plant.

- Ensuring safety means ensuring the quality requirement as brought out during
  - design & engineering,
  - procurement & construction and
  - > Operation and maintenance of plant.

> Timely completion of project in itself ensures quality and thus safety. This requires-

A well planned project strategy to meet all requirements.

- > On time regulatory clearances.
- > Industry meeting schedule requirements.

#### **Project Strategy**

- > Standardisation of design is the key.
- ➤ Keeping GHAVP-1&2 as the standard model, two enveloping designs; one for soil strata and other for rock strata have been envisaged.
- ➤ All construction drawings will be available prior to FPC.

#### **Project Strategy**

> Supply of free issue material for all major and critical equipment.

Strategy for procurement of major equipment finalized to provide assurance regarding continuity of orders to the Industry.

#### **Project Strategy**

➤ Feed back obtained from industry is being appropriately addressed in tendering conditions.

➤ Augmentation of manpower for fleet mode implementation initiated, with immediate emphasis on enhancement in QA manpower.

#### **Regulatory Support**

➤ Regulatory clearance for two standard designs i.e. one for soil strata and other for rock strata.

Project wise review to be limited to site specific design parameters and design documents.

#### **Regulatory Support**

- > Combined siting and excavation consent.
- > Early Regulatory clearance for DBGM.
- ➤ Single construction consent for FPC and major equipment erection.

#### **Challenges for Industry**

Mobilization of resources by Industry to maintain supply requirements.

➤ To build robust internal QA system and Focus on *First time correct approach*.

➤ Retention and development of skilled manpower in manufacturing, construction and quality assurance.

#### **Challenges for Industry**

- Simultaneous construction activity at multiple Sites.
- Strengthening financial capacity to meet large supply requirements.
- Quality issues in the recent past is an area of concern- Industry need to address.
- > Expect Industry to learn from experience of KAPP-3&4 and RAPP-7&8.

➤ Timely completion of project and a strong quality culture in Nuclear Industry will ensure Nuclear safety.

## Thank You
